

1. Undo and Redo features
2. Focusing away from a text box should keep the changes throughout the entire application but this feature is working just for some parts of the application it should be consistent in all parts of the application.
3. Selecting multiple steps of choice feature not available. One should be able to select multiple steps while leaving some steps unselected in between.
 - 3.1. After having the above feature one should be able to disable multiple selected steps of choice if they are not depended on one another. One example could be disabling all the selected waitSeconds steps with a click after selecting them. there might be situations where steps can be disabled safely.
4. I faced issues when using the application (403, authorization error) and I always had to close the application and reopen the application manually if there was a restart that could automate this process. The restarting process could happen in the background making user able to use the application in a state it was before without taking user to the home page in the restart process.
5. When deleting more than one data value in data tab if the data values are referenced in a test after clicking delete, for every one of the data values it asks whether to delete it or not.
Suggestion : it would be better to have an option enabling you to delete all the selected data values with a single click.

6. A button that selects all the steps in the flowchart.

Features I like about the applications:

1. Less to no coding experience required to use the application.
2. Very good library of components.
3. Scripting feature.
4. Simple, intuitive UI.
